Evidence hierarchy for the current EOL/RUL package

Rows separate formal strict evidence, comparators, diagnostics, prototypes, and negative/risk-control results.

Evidence line	Metric	Role	Safe interpretation
Strict main baseline	RMSE 56.19, MAE 49.42	Current main quantitative proof-of-concept	Batch9-selected strict baseline; Batch10 is final blind-test reporting only.
Strict source-only comparator	RMSE 64.27, MAE 55.21	Comparator for labeled target-adapt gain	Shows the fixed model without labeled Batch9 target cells.
Raw-provenance v3 diagnostic	RMSE 74.12, MAE 63.16	Raw-feature provenance and online-availability diagnostic	Direct raw our_data/*.pkl features support traceability, not superiority over the strict main result.
Neural v1 prototype	RMSE 68.68, MAE 60.30	Physics-consistent neural prototype	Useful prototype, but weaker than the strict ExtraTrees main result on Batch10.
Residual calibration negative result	RMSE 100.26, MAE 92.90	Negative/risk-control evidence	Batch9 improvement does not transfer; Batch10 worsens, so the residual correction is not retained.
Uncertainty diagnostic	80% half-width 129.42 cycles; coverage 8/8	Limited uncertainty diagnostic	Finite 80% interval only; 90% and 95% standard split-conformal intervals are unbounded with eight calibration cells.

Batch 10 values are final reporting only. They are not used here to select models or promote subset-specific results.
